BLADECORE™

**MADE TO
WORK**

BLADE

**WITH OVER THREE
THE SCRAP AND
BUSINESS, WE KNOW**

BladeCore offers the highest quality blades on the market today. Through our partnership with the designing and manufacturing community, we've discovered great success with a blade called Chrome Boron that provides superior production over a standard blade.

On select models, we also work with a blade material composed of 4% Nickel, called "High Alloy" blade. The nickel content makes the blade extremely tough and has doubled our customers' production, particularly well in the hardest materials like rebar, and stainless.

PEANUT BUTTER AND JELLY

When it comes to blades, we know what's the best because we've tried them. We've put in the time and spent the money to know what metallurgies are the most effective, which heat treatment processes are the best, and why. We've spent decades building relationships with some of the best blade manufacturers in the world.

Do we sell quality stuff? For sure we do. Ask us, and we'll tell you it's the best out there. The difference with BladeCore is we've listened to our customers, and they tell us they are looking for more than just a quality product. They're looking to make one phone call to a person they trust and know that they're going to be taken care of. That's our pledge to our customers.

Quality without premium service and relationships is like peanut butter without jelly. We're out to make the BladeCore experience the best damn PB & J our customers have ever had.

ECORE™

**SEVERAL DECADES IN
DEMOLITION
CUTTING BLADES.**

Quality replacement blades
from our experience working
in the manufacturing of mobile shears,
combined with a specialized material
blend provides a 20-30% increase in
blade life.

Work with a different type of
material, which we refer to as the
ECORE content in this material
blend, and in many cases, has
increased production. This blade performs
well in a variety of conditions like cable,

BLADES, BOLTS, AND SHIMS

We are all about blades, and only blades. This allows us to put our own spin on structural improvements and design modifications in order to increase blade life and provide for a more user-friendly installation. We provide blade kits, as well as bolt and shim kits, for a variety of mobile shears including Genesis, Labounty, and Fortress.

We have many customers who have asked us to produce blades for their stationary shears like Sierra, Copex, Harris, Metso, and Bonfiglioli. Our answer is yes.

We'll work with you to manufacture blades for your shear with the blade material best for your specific application.
